“The chapter you are learning about today is going to save someone's life tomorrow. Pay attention.”

Perceptions on burnout and medical school learning:

**Key Points**

**Question** How are medical students' racial and ethnic identities and perceptions of the medical school learning environment associated with burnout?

**Findings** In this survey study of 26567 graduating medical students, medical students who are underrepresented in medicine (URIM) reported experiencing modestly higher levels of exhaustion-related burnout and were at increased odds of experiencing burnout if they experienced racial discrimination during training.

**Meaning** The medical school learning environment influences burnout among all medical students, but students who are URIM experience higher rates of discrimination and exhaustion-related burnout; reducing discrimination and identifying and addressing relevant components of the learning environment must be prioritized to prevent burnout in medical students who are URIM.
